

This volume presents the complete Principia Orthogona series: a unified mathematical framework for generative transitions developed by Pablo Nogueira Grossi over twenty-five years.

Volume I introduces the operator sequence $C \rightarrow K \rightarrow F \rightarrow U$ on a Riemannian manifold, establishing the geometric precursor of all subsequent structure.

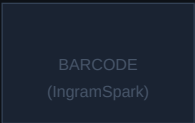

Volume II constructs the contact-geometric realization: the dm3 system, operator algebra, and four main theorems including explicit structural stability with radius $e_0 = 1/3$.

Volume III instantiates the framework in biology: allostatic stress, neural oscillations, circadian rhythms, and immune adaptation, with three falsifiable predictions.
